lytical results obtained from the Lagrange Planetary equations when impulsive thrusting is assumed. Propellant mass expenditures can also be obtained. This planning tool has application in the following areas:

- (1) Operational interruption prediction;
- (2) Propellant depletion rate studies;
- (3) Operational flight strategy development;
- (4) Orbit adjust impact assessment, and
- (5) General mission planning

## 1. INTRODUCTION

The Low Altitude satellite Mission Planner (LAMP) is an analytic orbit planning software tool which can be used to estimate the decay history/lifetime and to generate orbital ephemerides for one or two close-Earth satellites ( $.01 \leq e \leq .10$ ) perturbed by atmospheric drag and by Earth oblateness due to the zonal harmonics  $J_2$ ,  $J_3$ , and  $J_4$ . LAMP is capable of providing rapid and accurate long term ( $\sim 90$  day) predictions of key Keplerian orbit parameters ( $a$ ,  $e$ ,  $i$ ,  $\Omega$ ,  $\omega$ ) and related quantities (e.g. perigee and apogee altitudes; drag decay rates; period; theoretical atmospheric density profiles and scale heights; orbital phase angles) without resorting to time consuming numerical integration schemes. It can also use input orbit adjust designs to compute the associated changes to orbit parameters and make post orbit adjust predictions. A multiple orbit adjust capability exists so that propellant and thruster lifetime estimates can be made. It is thus likely that LAMP can be successfully applied to the analysis of problems in the following areas:

- (i) general mission planning;
- (ii) flight strategy development;
- (iii) orbit adjust impact assessment;
- (iv) propellant depletion rate studies; and
- (v) operational interruption prediction.

The following sections discuss in detail both the mathematical and the processing methodologies employed within LAMP. Included in this discussion are descriptions of the ephemeris generation capabilities; the drag decay rate theory used by LAMP; the effect of impulsive thrusting upon orbit parameters; LAMP initialization techniques; auxiliary computations required to support processing; and input/output options.

## 2. EPHEMERIS GENERATION

### 2.1 Force Model

For most close-Earth, low altitude artificial satellites with small eccentricities, the only perturbations which need be considered are those produced by the second through the fourth zonal harmonics of the geopotential function, i.e. the  $J_2$ ,  $J_3$ , and  $J_4$  terms, and atmospheric drag deceleration. The perturbations due to other forces, e.g. higher order geopotential perturbations, solar radiation pressure, luni-solar effects, etc., are generally much smaller than the effects induced by the basic uncertainties in the knowledge of the atmospheric density and satellite ballistic coefficient. Consequently, the geopotential oblateness perturbations due to  $J_2$ ,  $J_3$ , and  $J_4$  and the atmospheric drag perturbation are the only continuous forces modeled in LAMP. The effect of perturbations due to periodic impulsive thrusting is also modeled in LAMP.

### 2.2 Mean Element Prediction

The mean orbital element prediction capability (MEP) is the foundation for all significant computations performed by LAMP. MEP is capable of generating predicted mean Keplerian orbital elements ( $a_m$ ,  $e_m$ ,  $i_m$ ,  $\Omega_m$ ,  $\omega_m$ ,  $M_m$ ) from initial conditions at time intervals  $\Delta t$  for

either short periods of time (i.e. hours or days) or long periods of time (i.e. weeks or months). When MEP is operating in the short term prediction mode (STP),  $\Delta t$  is taken to be a fixed time interval, whereas when MEP is operating in the long term prediction mode (LTP),  $\Delta t$  is taken to be the approximate current nodal period  $\tau$ .

The algorithm used to generate predicted mean Keplerian elements at time  $t_i$ , i.e. the MEP algorithm, is:

$$\left. \begin{aligned}
 a_m(t_i) &= a_m(t_{i-1}) + \left[ \frac{\Delta a_D(t_{i-1})}{\tau_{i-1}} \right] \Delta t + \Delta a_{OA}(t_{i-1}) \delta_{t_{OA}}, \Delta t, \\
 e_m(t_i) &= e_m(t_{i-1}) + \langle \dot{e}_G(t_{i-1}) \rangle \Delta t + \left[ \frac{\Delta e_D(t_{i-1})}{\tau_{i-1}} \right] \Delta t + \Delta e_{OA}(t_{i-1}) \delta_{t_{OA}}, \Delta t, \\
 i_m(t_i) &= i_m(t_{i-1}) + \langle \dot{i}_G(t_{i-1}) \rangle \Delta t + \Delta i_{OA}(t_{i-1}) \delta_{t_{OA}}, \Delta t, \\
 \Omega_m(t_i) &= \Omega_m(t_{i-1}) + \langle \dot{\Omega}_G(t_{i-1}) \rangle \Delta t + \Delta \Omega_{OA}(t_{i-1}) \delta_{t_{OA}}, \Delta t, \\
 \omega_m(t_i) &= \omega_m(t_{i-1}) + \langle \dot{\omega}_G(t_{i-1}) \rangle \Delta t + \Delta \omega_{OA}(t_{i-1}) \delta_{t_{OA}}, \Delta t, \\
 M_m(t_i) &= M_m(t_{i-1}) + \langle \dot{M}_G(t_{i-1}) \rangle \Delta t + \Delta M_{OA}(t_{i-1}) \delta_{t_{OA}}, \Delta t,
 \end{aligned} \right\} \quad (2.1)$$

and

$$\tau_i = \tau_{i-1} + \frac{3}{2} \left[ \frac{\tau_{i-1}}{a_m(t_i)} \right] \left[ \frac{\Delta a_D(t_i)}{\tau_{i-1}} \right] \Delta t + \Delta r_{OA}(t_{i-1}) \delta_{t_{OA}}, \Delta t,$$

where  $t_i \in [t_O, t_E]$ ,  $t_E$  is the end time for the prediction interval, and

$$\Delta t = \begin{cases} t_i - t_{i-1} & \text{for the STP mode} \\ \tau_{i-1} & \text{for the LTP mode.} \end{cases} \quad (2.2)$$

In equations (2.1) the quantities  $\Delta X_D(t_{i-1})$  are the changes in the  $X_m$  orbital elements over one orbital revolution due to drag deceleration evaluated in terms of the mean orbital elements at time  $t_{i-1}$ ;  $\langle \dot{X}_G(t_{i-1}) \rangle$  are the rates of change of the  $X_m$  orbital elements due to  $J_2$ ,  $J_3$ , and  $J_4$  averaged with respect to mean anomaly and evaluated in terms of the mean orbital elements at time  $t_{i-1}$ ; and  $\Delta X_{OA}$  are the changes in the  $X_m$  orbital elements and nodal period due to impulsive thrusting and evaluated in terms of the mean orbital elements at  $t_{i-1}$ . The  $\delta_{t_{OA}}$ ,  $\Delta t$  is a

Kronecker delta defined by:

$$\delta_{t_{OA}, \Delta t} = \begin{cases} 1, & \text{for } t_{i-1} < t_{OA} \leq t_i \\ 0, & \text{otherwise,} \end{cases} \quad (2.3)$$

where  $t_{OA}$  is the time of the impulsive thrust. The quantities  $\Delta X_D$ ,  $\Delta X_{OA}$ , and  $\langle \dot{X}_G \rangle$  are discussed further in the following sections.

### 2.3 Osculating Element Prediction

The osculating element prediction capability (OEP) is generally used in conjunction with the MEP capability in the STP mode to generate predicted sets of osculating Keplerian orbital elements ( $a_{osc}$ ,  $e_{osc}$ ,  $i_{osc}$ ,  $\Omega_{osc}$ ,  $\omega_{osc}$ ,  $M_{osc}$ ) or Cartesian components at fixed time intervals  $\Delta t$ . The algorithm used to generate the osculating Keplerian elements at time  $t_i$ , i.e. the OEP algorithm, is:

$$\left. \begin{aligned} a_{osc}(t_i) &= a_m(t_i) + a_{sp}(t_i), \\ e_{osc}(t_i) &= e_m(t_i) + e_{sp}(t_i), \\ i_{osc}(t_i) &= i_m(t_i) + i_{sp}(t_i), \\ \Omega_{osc}(t_i) &= \Omega_m(t_i) + \Omega_{sp}(t_i), \\ \omega_{osc}(t_i) &= \omega_m(t_i) + \omega_{sp}(t_i), \end{aligned} \right\} \quad (2.4)$$

and

$$M_{osc}(t_i) = M_m(t_i) + M_{sp}(t_i),$$

where ( $a_m$ ,  $e_m$ ,  $i_m$ ,  $\Omega_m$ ,  $\omega_m$ ,  $M_m$ ) are the mean Keplerian orbital elements at time  $t_i$  computed using the MEP algorithm of equations (2.1), and ( $a_{sp}$ ,  $e_{sp}$ ,  $i_{sp}$ ,  $\Omega_{sp}$ ,  $\omega_{sp}$ ,  $M_{sp}$ ) are the first order short periodic variations of the Keplerian element set evaluated using the mean Keplerian set at time  $t_i$ . These short periodic variations are discussed further in the following sections.

## 2.4 Averaged Variational Equations Due to $J_2$ , $J_3$ , and $J_4$

The averaged motion of a low altitude, close-Earth satellite resulting only from perturbations due to the second through the fourth zonal harmonic terms of the geopotential function, i.e. the  $\langle \dot{X}_G \rangle$  factors of equations (2.1) are computed from the following expressions<sup>1</sup>:

$$\langle \dot{a}_G \rangle = 0 ,$$

$$\begin{aligned} \langle \dot{e}_G \rangle &= -\frac{3}{32} nJ_2^2 \left(\frac{R}{p}\right)^4 \sin^2 i (14 - 15 \sin^2 i) e (1-e^2) \sin 2\omega - \frac{3}{8} nJ_3 \left(\frac{R}{p}\right)^3 \\ &\quad \times \sin i (4-5 \sin^2 i) (1-e^2) \cos \omega - \frac{15}{32} nJ_4 \left(\frac{R}{p}\right)^4 \sin^2 i (6-7 \sin^2 i) e \\ &\quad \times (1-e^2) \sin 2\omega , \end{aligned}$$

$$\begin{aligned} \langle \dot{i}_G \rangle &= \frac{3}{64} nJ_2^2 \left(\frac{R}{p}\right)^4 \sin 2i (14-15 \sin^2 i) e^2 \sin 2\omega + \frac{3}{8} nJ_3 \left(\frac{R}{p}\right)^3 \cos i (4-5 \sin^2 i) \\ &\quad \times e \cos \omega + \frac{15}{64} nJ_4 \left(\frac{R}{p}\right)^4 \sin 2i (6-7 \sin^2 i) e^2 \sin 2\omega , \end{aligned}$$

$$\begin{aligned} \langle \dot{\Omega}_G \rangle &= -\frac{3}{2} nJ_2 \left(\frac{R}{p}\right)^2 \cos i - \frac{3}{2} nJ_2^2 \left(\frac{R}{p}\right)^4 \cos i \left[ \frac{9}{4} + \frac{3}{2} \sqrt{1-e^2} \right. \\ &\quad \left. - \sin^2 i \left( \frac{5}{2} + \frac{9}{4} \sqrt{1-e^2} \right) + \frac{e^2}{4} \left( 1 + \frac{5}{4} \sin^2 i \right) + \frac{e^2}{8} (7-15 \sin^2 i) \cos 2\omega \right] \\ &\quad - \frac{3}{8} nJ_3 \left(\frac{R}{p}\right)^3 (15 \sin^2 i - 4) e \cot i \sin \omega + \frac{15}{16} nJ_4 \left(\frac{R}{p}\right)^4 \cos i \\ &\quad \times \left[ \left( 4-7 \sin^2 i \right) \left( 1 + \frac{3}{2} e^2 \right) - (3-7 \sin^2 i) e^2 \cos 2\omega \right] , \end{aligned}$$

$$\begin{aligned} \langle \dot{\omega}_G \rangle &= \frac{3}{4} nJ_2 \left(\frac{R}{p}\right)^2 (4-5 \sin^2 i) + \frac{3}{16} nJ_2^2 \left(\frac{R}{p}\right)^4 \left\{ 48-103 \sin^2 i \right. \\ &\quad \left. + \frac{215}{4} \sin^4 i + \left( 7 - \frac{9}{2} \sin^2 i - \frac{45}{8} \sin^4 i \right) e^2 \right\} \end{aligned}$$

\end{aligned}$$

where  $R$  is the equatorial radius of the Earth,  $n$  is the mean motion given by

$$n = \left( \frac{\mu}{a^3} \right)^{1/2}, \quad (2.6)$$

$\mu$  is the Earth's gravitational constant, and

$$p = a(1 - e^2). \quad (2.7)$$

Note that when computing the  $\langle \dot{x}_G \rangle$  in equations (2.2), mean Keplerian elements should be used in the right hand sides of equations (2.5).

## 2.5 Semianalytic Atmospheric Drag Decay Rates

For close-Earth satellites the principal drag effects are perturbations in  $a$  and  $e$ . The remaining effects are small and for computational efficiency have been ignored in equations (2.1). The changes in  $a_m$  and  $e_m$  per orbital revolution due to drag deceleration by an oblate atmosphere with diurnal density variation are given by:<sup>2</sup>

$$\begin{aligned}
\Delta a_D &= -2\pi \delta \rho_0 g a^2 \exp[-\beta ae - c \cos 2\omega] \cdot \left\{ I_0 + 2eI_1 + FA \left[ I_1 \right. \right. \\
&\quad \left. \left. + \frac{1}{2} e(I_0 + 3I_2) \right] + c \left\{ I_2 + 2eI_3 + \frac{1}{2} FA \left[ I_1 + I_3 + \frac{1}{2} e(I_0 \right. \right. \\
&\quad \left. \left. + 2I_2 + 5I_4) \right] \right\} \cos 2\omega - \frac{1}{2} cFB \left\{ I_1 - I_3 + \frac{1}{2} e(I_0 + 4I_2 \right. \right. \\
&\quad \left. \left. + 2I_4) \right\} \right\} \cos 2\omega - \frac{1}{2} cFB \left\{ I_1 - I_3 + \frac{1}{2} e(I_0 + 4I_2 \right. \right. \\
&\quad \left. \left. + 2I_4) \right\} \cos 2\omega
\end{aligned}$$

<sup>2</sup>Santora, F. A., "Satellite Drag Perturbations in an Oblate Atmosphere With Day-To-Night Density Variation," AIAA Paper 74-839, AIAA Mechanics and Control of Flight Conference, Anaheim, California, August 1974.

$$\begin{aligned}
& - 5I_4 \Big) \Big\} \sin 2\omega + \frac{1}{4} c^2 \left\{ I_0 + 2eI_1 + FA \left[ I_1 + \frac{1}{2} e (I_0 + 3I_2) \right] \right\} \\
& + \frac{1}{4} c^2 \left\{ I_4 - e (I_3 - 3I_5) + \frac{1}{2} FA \left[ I_3 + I_5 - \frac{1}{2} e (I_2 - 2I_4 - 7I_6) \right] \right\} \\
& \times \cos 4\omega - \frac{1}{8} c^2 FB \left\{ I_3 - I_5 + \frac{1}{2} e (I_2 - 8I_4 + 7I_6) \right\} \sin 4\omega,
\end{aligned} \tag{2.8}$$

and

$$\Delta e_D = \frac{\Delta(ae)_D - e\Delta a_D}{a}, \tag{2.9}$$

where

$$\begin{aligned}
\Delta(ae)_D = & - 2\pi\delta\rho_0 ga^2 \exp \left[ -\beta ae - c \cos 2\omega \right] \cdot \left\{ I_1 + \frac{1}{2} e (3I_0 + I_2) \right. \\
& + \frac{1}{2} FA \left[ I_0 + I_2 + e (3I_1 + I_3) \right] + \frac{1}{2} c \left\{ I_1 + I_3 - \frac{1}{2} e (I_0 \right. \\
& \left. - 6I_2 - 3I_4) + \frac{1}{2} FA \left[ I_0 + 2I_2 + I_4 + e (I_1 + 2I_3 + I_5) \right] \right\} \\
& \times \cos 2\omega - \frac{1}{4} cFB \left\{ I_0 - I_4 + 2e (2I_1 - I_3 - I_5) \right\} \sin 2\omega \\
& + \frac{1}{4} c^2 \left\{ I_1 + \frac{1}{2} e (3I_0 + I_2) + \frac{1}{2} FA \left[ I_0 + I_2 + e (3I_1 + I_3) \right] \right\} \\
& + \frac{1}{8} c^2 \left\{ I_3 + I_5 - \frac{1}{2} e (3I_1 - 6I_4 - 5I_6) + \frac{1}{2} FA \left[ I_2 + 2I_4 + I_6 \right. \right. \\
& \left. \left. + e (3I_1 + 5I_3 + I_5 + 3I_7) \right] \right\} \cos 4\omega - \frac{1}{16} c^2 FB \left\{ I_2 - I_6 \right. \\
& \left. + e (3I_1 - 3I_3 - I_5 + 3I_7) \right\} \sin 4\omega.
\end{aligned} \tag{2.10}$$

In the expressions above  $g$  is the gravitational acceleration at the surface of the Earth,  $\beta$  is the reciprocal of the density scale height  $H$ , and

$$\delta = \left( \frac{C_D S}{W} \right) \left[ 1 - \frac{r_p}{v_p} \Lambda \omega_e \cos i \right]^2, \tag{2.11}$$

$$\rho_o = \frac{1}{2} (\rho_{\max} + \rho_{\min}) , \quad (2.12)$$

$$F = \frac{\rho_{\max} - \rho_{\min}}{\rho_{\max} + \rho_{\min}} , \quad (2.13)$$

$$A = \sin \delta_B \sin i \sin \omega + \cos \delta_B [\cos(\Omega - a_B) \cos \omega - \cos i \sin(\Omega - a_B) \sin \omega] , \quad (2.14)$$

$$B = \sin \delta_B \sin i \cos \omega - \cos \delta_B [\cos(\Omega - a_B) \sin \omega + \cos i \sin(\Omega - a_B) \cos \omega] , \quad (2.15)$$

$$c = \frac{1}{2} \beta r_p \epsilon \sin^2 i , \quad (2.16)$$

and the  $I_n$  ( $n = 0, 1, 2, \dots, 7$ ) are Bessel functions of the first kind and imaginary argument given by:

$$I_n(\beta ae) = \frac{1}{2\pi} \int_0^{2\pi} \cos(nE) \exp[\beta ae \cos E] dE . \quad (2.17)$$

In equations (2.11) - (2.16)  $\frac{C_D S}{W}$  is the inverse ballistic coefficient for the satellite;  $r_p$  and  $v_p$  are the perigee radius and velocity;  $\Lambda$  is the ratio of atmospheric rotation rate to Earth rotation rate,  $\omega_e$ ;  $\rho_{\max}$  and  $\rho_{\min}$  are the densities at the diurnal bulge location and diametrically opposite the bulge, respectively, at distance  $r_p$ ;  $a_B$  and  $\delta_B$  are the right ascension and declination of the diurnal bulge; and  $\epsilon$  is the ellipticity of the Earth. When using these expressions in the MEP algorithm of equations (2.1) mean orbital elements and an osculating perigee radius,  $r_{\text{posc}}$ , are used in their evaluation. The osculating perigee radius is given by

$$r_{\text{posc}} = a_m (1 - e_m) + r_{sp} (f \approx 0) , \quad (2.18)$$

where  $r_{sp}$  is defined in the following section. Values for  $\rho$  and  $\beta$  are obtained using the NSWC/Jacchia 1977-Bass model atmosphere.

## 2.6 First Order Short Periodic Variations

The first order short periodic variations which are used to compute the osculating orbital elements of equations (2.4) and the osculating perigee distance of equation (2.18) are given by:<sup>1</sup>

$$\left. \begin{aligned}
 a_{sp} &= J_2 \left( \frac{R^2}{a} \right) \left( \frac{a}{r} \right)^3 \left[ 1 - \frac{3}{2} \sin^2 i + \frac{3}{2} \sin^2 i \cos 2(\omega + f) \right. \\
 &\quad \left. - \left( 1 - \frac{3}{2} \sin^2 i \right) (1 - e^2)^{-3/2} \right], \\
 e_{sp} &= \frac{1}{2} J_2 \left( \frac{R}{p} \right)^2 \left( 1 - \frac{3}{2} \sin^2 i \right) \left\{ \frac{1}{e} \left[ 1 + \frac{3}{2} e^2 - (1 - e^2)^{3/2} \right] \right. \\
 &\quad + 3 \left( 1 + \frac{e^2}{4} \right) \cos f + \frac{3}{2} e \cos 2f + \frac{e^2}{4} \cos 3f \\
 &\quad + \frac{3}{8} J_2 \left( \frac{R}{p} \right)^2 \sin^2 i \left[ \left( 1 + \frac{11}{4} e^2 \right) \cos (2\omega + f) + \frac{e^2}{4} \cos (2\omega - f) \right. \\
 &\quad + 5e \cos (2\omega + 2f) + \frac{1}{3} \left( 7 + \frac{17}{4} e^2 \right) \cos (2\omega + 3f) \\
 &\quad \left. \left. + \frac{3}{2} e \cos (2\omega + 4f) + \frac{e^2}{4} \cos (2\omega + 5f) + \frac{3}{2} e \cos 2\omega \right] , \right. \\
 i_{sp} &= \frac{3}{8} J_2 \left( \frac{R}{p} \right)^2 \sin 2i \left[ e \cos (2\omega + f) + \cos 2(\omega + f) \right. \\
 &\quad \left. + \frac{e}{3} \cos (2\omega + 3f) \right],
 \end{aligned} \right\}$$

$$\begin{aligned}
\omega_{sp} &= \frac{3}{4} J_2 \left(\frac{R}{p}\right)^2 (4 - 5 \sin^2 i) (f - M + e \sin f) \\
&\quad + \frac{3}{2} J_2 \left(\frac{R}{p}\right)^2 \left(1 - \frac{3}{2} \sin^2 i\right) \left[ \frac{1}{e} \left(1 - \frac{1}{4} e^2\right) \sin f + \frac{1}{2} \sin 2f \right. \\
&\quad \left. + \frac{1}{12} e \sin 3f \right] - \frac{3}{2} J_2 \left(\frac{R}{p}\right)^2 \left\{ \frac{1}{e} \left[ \frac{1}{4} \sin^2 i + \frac{e^2}{2} \left(1 - \frac{15}{8} \sin^2 i\right) \right] \right. \\
&\quad \times \sin(2\omega + f) + \frac{e}{16} \sin^2 i \sin(2\omega - f) + \frac{1}{2} \left(1 - \frac{5}{2} \sin^2 i\right) \\
&\quad \times \sin 2(\omega + f) - \frac{1}{e} \left[ \frac{7}{12} \sin^2 i - \frac{e^2}{6} \left(1 - \frac{19}{8} \sin^2 i\right) \right] \\
&\quad \times \sin(2\omega + 3f) - \frac{3}{8} \sin^2 i \sin(2\omega + 4f) - \frac{e}{16} \sin^2 i \sin(2\omega + 5f) \\
&\quad \left. - \frac{9}{16} J_2 \left(\frac{R}{p}\right)^2 \sin^2 i \sin 2\omega \right\}, \\
\Omega_{sp} &= -\frac{3}{2} J_2 \left(\frac{R}{p}\right)^2 \cos i \left[ f - M + e \sin f - \frac{e}{2} \sin(2\omega + f) \right. \\
&\quad \left. - \frac{1}{2} \sin 2(\omega + f) - \frac{e}{6} \sin(2\omega + 3f) \right], \\
M_{sp} &= -\frac{3}{2} J_2 \left(\frac{R}{p}\right)^2 \frac{\sqrt{1-e^2}}{e} \left\{ \left(1 - \frac{3}{2} \sin^2 i\right) \left[ \left(1 - \frac{1}{4} e^2\right) \sin f \right. \right. \\
&\quad \left. + \frac{e}{2} \sin 2f + \frac{e^2}{12} \sin 3f \right] + \frac{1}{2} \sin^2 i \left[ -\frac{1}{2} \left(1 + \frac{5}{4} e^2\right) \sin(2\omega + f) \right. \\
&\quad \left. - \frac{e^2}{8} \sin(2\omega - f) + \frac{7}{6} \left(1 - \frac{e^2}{28}\right) \sin(2\omega + 3f) \right. \\
&\quad \left. + \frac{3}{4} e \sin(2\omega + 4f) + \frac{e^2}{8} \sin(2\omega + 5f) \right\} \\
&\quad + \frac{9}{16} J_2 \left(\frac{R}{p}\right)^2 \sqrt{1-e^2} \sin^2 i \sin 2\omega,
\end{aligned}$$

and

$$\begin{aligned} r_{sp} &= -\frac{1}{2} J_2 \left( \frac{R^2}{p} \right) \left( 1 - \frac{3}{2} \sin^2 i \right) \left[ 1 + \frac{e}{1 + \sqrt{1 - e^2}} \cos f \right. \\ &\quad \left. + \frac{2}{\sqrt{1 - e^2}} \left( \frac{r}{a} \right) \right] + \frac{1}{4} J_2 \left( \frac{R^2}{p} \right) \sin^2 i \cos (2\omega + 2f), \end{aligned}$$

where  $f$  is the satellite true anomaly which can be computed from  $M$  (see section 4.1). Note that when computing the  $X_{sp}$  in equations (2.4) and equation (2.18), mean Keplerian elements are used in the right hand sides of equations (2.19).

## 2.7 Instantaneous Orbit Parameter Changes Due to Impulsive Thrusting

The changes in orbit parameters due to instantaneous velocity changes are modeled from the results obtained from the Lagrange Planetary Equations.<sup>3</sup> Let the instantaneous velocity change due to an impulsive thrust,  $\Delta \vec{V}$ , be given by

$$\Delta \vec{V} = \Delta V_R \hat{R} + \Delta V_I \hat{I} + \Delta V_C \hat{C}, \quad (2.20)$$

where

$$\hat{C} = \frac{\vec{r} \times \dot{\vec{r}}}{|\vec{r} \times \dot{\vec{r}}|}, \quad (2.21)$$

$$\hat{I} = \frac{\dot{\vec{r}}}{|\dot{\vec{r}}|}, \quad (2.22)$$

and

$$\hat{R} = \hat{I} \times \hat{C}. \quad (2.23)$$

---

<sup>3</sup> Fitzpatrick, P. M., *Principles of Celestial Mechanics*, Academic Press, Inc., New York, New York, 1970.

Here  $\vec{r}$  and  $\vec{v}$  are the satellite velocity and position vectors. The instantaneous changes in the Keplerian orbital elements and the period resulting from this velocity change are:

$$\left. \begin{aligned} \Delta a_{OA} &= 2a^2 \left( \frac{v}{\mu} \right) \Delta V_I , \\ \Delta e_{OA} &= \frac{r \sin f}{av} \Delta V_R + 2 \left( \frac{\cos f + e}{v} \right) \Delta V_I , \\ \Delta i_{OA} &= \frac{r \cos (\omega + f)}{(\mu p)^{1/2}} \Delta V_c , \\ \Delta \Omega_{OA} &= \frac{r \sin (\omega + f)}{(\mu p)^{1/2} \sin i} \Delta V_c , \\ \Delta \omega_{OA} &= - \frac{(1 + e^2) \cos f + 2e}{e(1 + e \cos f)v} \Delta V_R + 2 \frac{\sin f}{ev} \Delta V_I \\ &\quad - \frac{r \sin (\omega + f) \cos i}{(\mu p)^{1/2} \sin i} \Delta V_C , \\ \Delta M_{OA} &= n - \left[ \frac{1}{a(1 - e^2)^{1/2} v} \right] \left\{ 2 \sin f \left[ \frac{a(1 - e^2)}{e} + re \right] \Delta V_I \right. \\ &\quad \left. - \left[ \frac{r}{e} (1 - e^2) \cos f \right] \Delta V_C \right\} , \end{aligned} \right\} \quad (2.24)$$

and

$$\Delta T_{OA} = 3 \tau a \left( \frac{v}{\mu} \right) \Delta V_I ,$$

where

$$v = \sqrt{\mu \left( \frac{2}{r} - \frac{1}{a} \right)} , \quad (2.25)$$

$$r = \frac{a(1 - e^2)}{1 + e \cos f} , \quad (2.26)$$

and  $f$  is the true anomaly at  $t_{OA}$ . Note that mean elements are used to evaluate the right hand sides of equations (2.24) – (2.26) when they are used in equations (2.1).

### 3. INITIALIZATION

#### 3.1 Initial Condition Transformations

The initial orbital elements may be input as either (a) mean Keplerian elements, (b) mean Brouwer elements, or (c) osculating Keplerian elements. Since LAMP prediction modes require mean Keplerian elements as initial conditions, input types (b) and (c) must be transformed to element type (a). If type (b) initial conditions are used, they are first transformed to type (c) elements at epoch  $t_o$  through application of the Brouwer-Lyddane<sup>4,5</sup> orbit theory using a vanishing prediction interval (this transformation is described in the following section). The type (c) elements are converted to type (a) by iterating upon the transformation

$$X_{mj}^{(k)}(t_o) = X_{oscj}(t_o) - X_{spj} \left( X_{m1}^{(k-1)}(t_o), \dots, X_{m6}^{(k-1)}(t_o) \right), \quad (j = 1, 2, \dots, 6), \quad (3.1)$$

until the condition

$$| X_{mj}^{(k)}(t_o) - X_{mj}^{(k-1)}(t_o) | < \epsilon_j, \quad (j = 1, 2, \dots, 6), \quad (3.2)$$

is satisfied for all  $j$ . In the above expressions  $k$  is the iteration counter;  $X_{mj}(t_o)$ ,  $X_{oscj}(t_o)$ , and  $X_{spj}(t_o)$  represent the mean and osculating values and the short periodic variation of the  $j^{\text{th}}$  element at epoch  $t_o$ ; and  $\epsilon_j$  is the convergence tolerance for the  $j^{\text{th}}$  element. To initiate this iterative process, it is assumed that

$$X_{mj}^{(0)}(t_o) = X_{oscj}(t_o), \quad (j = 1, 2, \dots, 6). \quad (3.3)$$

#### 3.2 Brouwer-Lyddane Transformation Theory

The Brouwer-Lyddane theory is used in LAMP to transform mean Brouwer elements to osculating Keplerian elements prior to converting them to mean Keplerian elements. The transformation to osculating Keplerian elements is accomplished by using the following relations with a zero time from epoch,  $t$ . The input mean Brouwer elements at epoch  $t_o$  are  $a''$ ,  $e''$ ,  $i''$ ,  $M_o''$ ,  $\omega_o''$ , and  $\Omega_o''$ . Define:

$t$  = time from epoch

$n_o = (\mu/a''^3)^{1/2}$

$\eta = (1 - e''^2)^{1/2}$

<sup>4</sup> Brouwer, D., "Solution of the Problem of Artificial Satellite Theory Without Drag," *The Astronomical Journal*, Vol. 64, No. 1274, 1959, pp. 378-397.

<sup>5</sup> Lyddane, R. H., "Small Eccentricities or Inclinations in the Brouwer Theory of Artificial Satellites," *The Astronomical Journal*, Vol. 68, No. 8, 1963, pp. 555-558.

$$\begin{aligned}
\theta &= \cos i'' \\
\gamma_2 &= \frac{1}{2} C_{20} a_e^2 / a''^2 \\
\gamma'_2 &= \gamma_2 \eta^{-4} \\
\gamma'_3 &= -C_{30} a_e^3 a''^{-3} \eta^{-6} \\
\gamma'_4 &= -\frac{3}{8} C_{40} a_e^4 a''^{-4} \eta^{-8} \\
\gamma'_5 &= -C_{50} a_e^5 a''^{-5} \eta^{-10} \\
a &= 1 - 5\theta^2 \\
\beta &= 1 - 11\theta^2 - 40\theta^4 a^{-1} \\
\gamma &= 1 - 3\theta^2 - 8\theta^4 a^{-1} \\
\delta &= 1 - 9\theta^2 - 24\theta^4 a^{-1} \\
\lambda &= 1 - 5\theta^2 - 16\theta^4 a^{-1}
\end{aligned}
\tag{3.4}$$

Then the secular terms are computed from:

$$\begin{aligned}
M'' &= n_o t \left\{ 1 + \frac{3}{2} \gamma'_2 \eta (3\theta^2 - 1) + \frac{3}{32} \gamma'^2_2 \eta \left[ -15 + 16\eta + 25\eta^2 \right. \right. \\
&\quad \left. \left. + (30 - 96\eta - 90\eta^2) \theta^2 + (105 + 144\eta + 25\eta^2) \theta^4 \right] \right. \\
&\quad \left. + \frac{15}{16} \gamma'_4 \eta e''^2 \left[ 3 - 30\theta^2 + 35\theta^4 \right] \right\} + M''_o ,
\end{aligned}
\tag{3.5}$$

$$\begin{aligned}
\omega'' &= n_o t \left\{ -\frac{3}{2} \gamma'_2 a + \frac{3}{32} \gamma'^2_2 \left[ -35 + 24\eta + 25\eta^2 + (90 - 192\eta - 126\eta^2) \theta^2 \right. \right. \\
&\quad \left. \left. + (385 + 360\eta + 45\eta^2) \theta^4 \right] + \frac{5}{16} \gamma'_4 \left[ 21 - 9\eta^2 + (-270 \right. \right. \\
&\quad \left. \left. + 126\eta^2) \theta^2 + (385 - 189\eta^2) \theta^4 \right] \right\} + \omega''_o ,
\end{aligned}
\tag{3.6}$$

nd

$$\begin{aligned}
\Omega'' &= n_o t \left\{ -3 \gamma'_2 \theta + \frac{3}{8} \gamma'^2_2 \left[ (-5 + 12\eta + 9\eta^2) \theta \right. \right. \\
&\quad \left. \left. + (-35 - 36\eta - 5\eta^2) \theta^3 \right] + \frac{5}{4} \gamma'_4 (5 - 3\eta^2) \theta (3 - 7\theta^2) \right\} + \Omega''_o .
\end{aligned}
\tag{3.7}$$

The long period (dependent upon  $\mathbf{g}''$ ) terms are computed from:

$$\begin{aligned}\delta_1 \mathbf{e} = & \frac{35}{96} \frac{\gamma'_s}{\gamma'_2} \mathbf{e}''^2 \eta^2 \lambda \sin i'' \sin^3 \omega'' - \frac{1}{12} \frac{\mathbf{e}'' \eta^2}{\gamma'_2} \left( 3\gamma'_2 \beta - 10\gamma'_4 \gamma \right) \sin^2 \omega'' \\ & - \frac{35}{128} \frac{\gamma'_s}{\gamma'_2} \mathbf{e}''^2 \eta^2 \lambda \sin i'' \sin \omega'' + \frac{1}{4} \frac{\eta^2}{\gamma'_2} \left[ \gamma'_3 \right. \\ & \left. + \frac{5}{16} \gamma'_s (4 + 3\mathbf{e}''^2) \delta \right] \sin i'' \sin \omega'' + \frac{\mathbf{e}'' \eta^2}{24 \gamma'_2} \left[ 3\gamma'_2 \beta - 10\gamma'_4 \gamma \right] ,\end{aligned}\quad (3.8)$$

$$\begin{aligned}\mathbf{M}' + \omega' = & \mathbf{M}'' + \omega'' + \frac{1}{2} \left\{ \frac{1}{24 \gamma'_2} \left[ -3\gamma'_2 \left\{ 2 + \mathbf{e}''^2 - 11(2 + 3\mathbf{e}''^2) \theta^2 \right. \right. \right. \\ & \left. \left. \left. - 40(2 + 5\mathbf{e}''^2) \theta^4 a^{-1} - 400\mathbf{e}''^2 \theta^6 a^{-2} \right\} + 10\gamma'_4 \left\{ 2 + \mathbf{e}''^2 \right. \right. \\ & \left. \left. - 3(2 + 3\mathbf{e}''^2) \theta^2 - 8(2 + 5\mathbf{e}''^2) \theta^4 a^{-1} - 80\mathbf{e}''^2 \theta^6 a^{-2} \right\} \right] \\ & \left. + \frac{\eta^3}{\gamma'_2} \left[ \frac{\gamma'_2}{4} \beta - \frac{5}{6} \gamma'_4 \gamma \right] \right\} \sin 2\omega'' + \left\{ \frac{35}{384} \frac{\gamma'_s}{\gamma'_2} \eta^3 \mathbf{e}'' \lambda \sin i'' \right. \\ & \left. + \frac{35}{1152} \frac{\gamma'_s}{\gamma'_2} \left[ \lambda \left\{ -\mathbf{e}'' (3 + 2\mathbf{e}''^2) \sin i'' + \frac{\mathbf{e}''^3 \theta^2}{\sin i''} \right\} \right. \right. \\ & \left. \left. + 2\mathbf{e}''^3 \theta^2 \sin i'' \left\{ 5 + 32\theta^2 a^{-1} + 80\theta^4 a^{-2} \right\} \right] \right\} \cos 3\omega'' \\ & + \left\{ -\frac{\gamma'_3 \mathbf{e}'' \theta^2}{4 \gamma'_2 \sin i''} + \frac{5}{64} \frac{\gamma'_s}{\gamma'_2} \left[ -\mathbf{e}'' \frac{\theta^2}{\sin i''} (4 + 3\mathbf{e}''^2) \right. \right. \\ & \left. \left. + \mathbf{e}'' \sin i'' (26 + 9\mathbf{e}''^2) \right] \delta - \frac{15}{32} \frac{\gamma'_s}{\gamma'_2} \mathbf{e}'' \theta^2 \sin i'' (4 + 3\mathbf{e}''^2) \right. \\ & \left. \times (3 + 16\theta^2 a^{-1} + 40\theta^4 a^{-2}) + \frac{1}{4} \frac{\gamma'_3}{\gamma'_2} \sin i'' \right. \\ & \left. \times \left( \frac{\mathbf{e}''}{1 + \eta^3} \right) \left[ 3 - \mathbf{e}''^2 (3 - \mathbf{e}''^2) \right] + \frac{5}{64} \frac{\gamma'_s}{\gamma'_2} \eta^2 \delta \right. \\ & \left. \times \left[ \frac{\mathbf{e}'' (-32 + 81\mathbf{e}''^4)}{4 + 3\mathbf{e}''^2 + \eta (4 + 9\mathbf{e}''^2)} \right] \sin i'' \right\} \cos \omega'' ,\end{aligned}\quad (3.9)$$

and

$$\begin{aligned}
 \Omega' = \Omega'' + & \frac{35\gamma'_5 e''^3 \theta}{144 \gamma'_2} \left\{ 5 \lambda \sin^{-1} i'' + \sin i'' \left[ 5 + 32\theta^2 a^{-1} + 80\theta^4 a^{-2} \right] \right\} \\
 & \times \sin^2 \omega'' \cos \omega'' + \frac{e''^2 \theta}{12 \gamma'_2} \left\{ -3 \gamma'_2^2 \left[ 11 + 80\theta^2 a^{-1} + 200\theta^4 a^{-2} \right] \right. \\
 & \left. + 10 \gamma'_4 \left[ 3 + 16\theta^2 a^{-1} + 40\theta^4 a^{-2} \right] \right\} \sin \omega'' \cos \omega'' \\
 & + \left\{ -\frac{35 \gamma'_5}{576 \gamma'_2} e''^3 \theta \left[ 5 \lambda \sin^{-1} i'' + \sin i'' (5 + 32\theta^2 a^{-1} + 80\theta^4 a^{-2}) \right] \right. \\
 & \left. + \frac{e'' \theta}{4 \gamma'_2 \sin i''} \left[ \gamma'_3 + \frac{5}{16} \gamma'_5 (4 + 3e''^2) \delta + \frac{15}{8} \gamma'_5 (4 + 3e''^2) \right. \right. \\
 & \left. \left. \times (3 + 16\theta^2 a^{-1} + 40\theta^4 a^{-2}) \sin^2 i'' \right] \right\} \cos \omega'' . 
 \end{aligned} \tag{3.10}$$

The short period (dependent upon  $E'$ ,  $f'$ ,  $M''$ ) are computed from:

$$\begin{aligned}
 a = a'' - a'' \frac{\gamma_2}{\eta^3} (3\theta^2 - 1) + & \left[ \frac{a'' \gamma_2}{(1 - e'' \cos E')^3} \right] \left[ 3\theta^2 - 1 \right. \\
 & \left. + 3 \sin^2 i'' \cos(2\omega'' + 2f') \right] , 
 \end{aligned} \tag{3.11}$$

$$\begin{aligned}
 e = e'' + \delta_1 e + & \frac{\eta^2 \gamma_2}{2} \left\{ \frac{3\theta^2 - 1}{\eta^6} \left[ \frac{e''}{1 + \eta^3} \left\{ 3 - e''^2 (3 - e''^2) \right\} \right. \right. \\
 & \left. + \left\{ 3 + e'' \cos f' + (3 + e'' \cos f') \right\} \cos f' \right] + \frac{3(1 - \theta^2)}{\eta^6} \left[ e'' \right. \\
 & \left. + \left\{ 3 + e'' \cos f' (3 + e'' \cos f') \right\} \cos f' \right] \cos(2f' + 2\omega'') \left. \right\} \\
 & - \frac{\eta^2 \gamma'_2}{2} (1 - \theta^2) \left[ 3 \cos(2\omega'' + f') + \cos(2\omega'' + 3f') \right] , 
 \end{aligned} \tag{3.12}$$

$$\begin{aligned}
 i = i'' - & \frac{e'' \theta}{\eta^2 \sin i''} \delta_1 e + e'' \gamma'_2 \theta \sin i'' \sin f' \sin(2f' + 2\omega'') \\
 & + 2e'' \gamma'_2 \theta \sin i'' \cos f' \cos(2f' + 2\omega'') + \frac{3}{2} \gamma'_2 \theta \sin i'' \cos(2f' + 3\omega'') , 
 \end{aligned} \tag{3.13}$$

$$\begin{aligned}\omega + M &= \omega' + M' + \frac{\gamma'_2}{4} \left\{ -6 a (f' - M'' + e'' \sin f') + (3 - 5\theta^2) \right. \\ &\quad \times \left[ 3 \sin (2f' + 2\omega'') + 3e'' \sin (2\omega'' + f') + e'' \sin (2\omega'' + 3f') \right] \left. \right\} \quad (3.14)\end{aligned}$$

$$\begin{aligned}\Omega &= \Omega' + \left[ 2e'' \gamma'_2 \theta \cos f' + \frac{3}{2} \gamma'_2 \theta \right] \sin (2\omega'' + 2f') \\ &\quad - e'' \gamma'_2 \theta \sin f' \cos (2f' + 2\omega'') - 3 \gamma'_2 \theta (f' - M'' + e'' \sin f') , \quad (3.15)\end{aligned}$$

and

$$\begin{aligned}e \delta \lambda &= \frac{1}{2} \frac{e'' \eta^3}{\gamma'_2} \left\{ \frac{1}{4} \gamma'_2 \beta - \frac{5}{6} \gamma'_4 \gamma \right\} \sin 2\omega'' - \left\{ \frac{1}{4} \frac{\gamma'_3}{\gamma'_2} \eta^3 \sin i'' \right. \\ &\quad + \frac{5}{64} \frac{\gamma'_5}{\gamma'_2} \eta^3 \sin i'' (4 + 9e'') \delta \left. \right\} \cdot \cos 2\omega'' \\ &\quad + \frac{35}{384} \frac{\gamma'_5}{\gamma'_2} \eta^3 e''^2 \lambda \sin i'' \cos 3\omega'' - \frac{1}{4} \gamma'_2 \eta^3 \left\{ 2(3\theta^2 - 1) \right. \\ &\quad \times (\sigma + 1) \sin f' + 3(1 - \theta^2)(1 - \sigma) \sin (2\omega'' + f') \\ &\quad \left. + (\sigma + 1/3) \sin (2\omega'' + 3f') \right\} , \quad (3.16)\end{aligned}$$

where

$$\sigma = \left( \frac{\eta}{1 - e'' \cos E'} \right)^2 + \left( \frac{1}{1 - e'' \cos E'} \right) , \quad (3.17)$$

the eccentric anomaly  $E'$  is obtained from a Newton-Raphson iteration upon the Kepler equation

$$E' - e'' \sin E' = M'' , \quad (3.18)$$

and the true anomaly  $f'$  is found from

$$\begin{aligned}\sin f' &= \frac{\eta \sin E'}{1 - e'' \cos E'} , \\ \cos f' &= \frac{\cos E' - e''}{1 - e'' \cos E'} .\end{aligned}\quad (3.19)$$

The final osculating values for  $a$ ,  $i$ , and  $\Omega$  are computed from equations (3.11), (3.13), and (3.15), respectively. Equations (3.5), (3.14), (3.12), and (3.16) are used to calculate final osculating values for  $M$ ,  $\omega$ , and  $e$  from the following relations:

$$A \approx e \cos M'' - e \delta \ell \sin M'' , \quad (3.20)$$

$$B \approx e \sin M'' + e \delta \ell \cos M'' , \quad (3.21)$$

$$M \approx \tan^{-1} (B/A) , \quad (3.22)$$

$$\omega \approx (M + \omega) - M , \quad (3.23)$$

and

$$e = (A^2 + B^2)^{1/2} . \quad (3.24)$$

#### 4. AUXILIARY COMPUTATIONS

##### 4.1 Initialization and OEP Support Computations

The initialization procedure and the osculating element prediction capability utilize equations (2.19) and, thus, require a method of computing the true anomaly from the mean anomaly. Since the eccentricities of interest are small (e.g.  $e \leq .1$ ), a truncated expansion of  $f$  in terms of  $M$  can be used with sufficient accuracy. This expansion is given by:

$$f = M + 2e \sin M + \frac{5}{4} e^2 \sin 2M + \frac{13}{12} e^2 \sin 3M . \quad (4.1)$$

The initial nodal period  $\tau$  must also be computed during the initialization phase. It is approximated by:

$$\tau = \left[ \frac{2\pi}{2\pi + \dot{\omega} \tau_K} \right] \tau_K , \quad (4.2)$$

where  $\tau$  is in seconds,

$$\tau_K = 2\pi \left( \frac{a'^3}{\mu} \right)^{1/2} , \quad (4.3)$$

and

$$\dot{\omega}' = 10^{-6} \left[ \frac{5 \cos^2 i' - 1}{a'^{7/2} (1 - e'^2)^2} \right], \quad (a' \text{ in earth radii}). \quad (4.4)$$

In the above expressions,  $a'$ ,  $i'$ , and  $e'$  are  $a_{osc}$ ,  $i_{osc}$ , and  $e_{osc}$  at  $t_N$ , the time of the first crossing of the ascending node after  $t_O$ .  $t_N$  is computed using an iterative procedure and the OEP/STP mode of ephemeris generation.

When generating osculating Cartesian components using the OEP capability, the following transformations are used:

$$\vec{r}_{osc} = a_{osc} Q \begin{pmatrix} \cos E_{osc} - e_{osc} \\ \sqrt{1 - e_{osc}^2} \sin E_{osc} \end{pmatrix}, \quad (4.5)$$

and

$$\dot{\vec{r}}_{osc} = \frac{(\mu a_{osc})^{1/2}}{a_{osc} (1 - e_{osc} \cos E_{osc})} Q \begin{pmatrix} -\sin E_{osc} \\ \sqrt{1 - e_{osc}^2} \cos E_{osc} \end{pmatrix}, \quad (4.6)$$

where

$$Q = \begin{pmatrix} \cos \Omega_{osc} \cos \omega_{osc} - \sin \Omega_{osc} \cos i_{osc} \sin \omega_{osc} & -\cos \Omega_{osc} \sin \omega_{osc} - \sin \Omega_{osc} \cos i_{osc} \cos \omega_{osc} \\ \cos \omega_{osc} \sin \Omega_{osc} + \cos \Omega_{osc} \cos i_{osc} \sin \omega_{osc} & \cos \Omega_{osc} \cos i_{osc} \cos \omega_{osc} - \sin \Omega_{osc} \sin \omega_{osc} \\ \sin i_{osc} \sin \omega_{osc} & \sin i_{osc} \cos \omega_{osc} \end{pmatrix}. \quad (4.7)$$

$E_{osc}$  is the osculating eccentric anomaly computed from Kepler's equation:

$$E_{osc} - e_{osc} \sin E_{osc} = M_{osc} . \quad (4.8)$$

#### 4.2 Drag Decay Rate Support Computations

The drag decay computations can model  $C_D S$  as either a constant or time varying quantity (note, however, that  $C_D S$  has been treated as a constant in the variational equations). The form used in LAMP is:

$$C_D S = (C_D S)_0 + (C_D S)_1 (t - t_0) + (C_D S)_2 \sin(\omega + \gamma_1) , \quad (4.9)$$

where the  $(C_D S)_i$  ( $i = 0, 1, 2$ ) are constant coefficients and  $\gamma_1$  is a phase factor.

The location of the diurnal bulge at a given time  $t$  is computed from:

$$\delta_B = \delta_O , \quad (4.10)$$

and

$$a_B = a_O + \Delta , \quad (4.11)$$

where  $\Delta$  is the bulge lag angle,

$$\delta_O = \sin^{-1} \left\{ \sin \epsilon_O \sin \lambda_O \right\} , -\epsilon_O \leq \delta_O \leq \epsilon_O , \quad (4.12)$$

and

$$a_O = \begin{cases} \eta & , 0 < \lambda_O < \pi/2 \\ \pi - \eta & , \frac{\pi}{2} < \lambda_O < \pi \\ & , 0 \leq a_O \leq 2\pi . \\ \pi + \eta & , \pi < \lambda_O < \frac{3\pi}{2} \\ 2\pi - \eta & , \frac{3\pi}{2} < \lambda_O < 2\pi \end{cases} \quad (4.13)$$

Here  $\epsilon_O$  is the solar obliquity,  $\lambda_O$  is the celestial longitude of the sun given by:

$$\lambda_O = \left( \frac{.9863\pi}{180} \right) \Delta t_V , 0 \leq \lambda_O \leq 2\pi , \quad (4.14)$$

and

$$\eta = \sin^{-1} \left\{ \tan \delta_0 \cot \epsilon_0 \right\} . \quad (4.15)$$

$\Delta t_V$  is the time elapsed in days since the last vernal equinox. It should be noted that

$$a_0 = \lambda_0 \text{ for } \lambda_0 = \frac{j}{2} \pi , \quad (j = 0, 1, 2, 3, 4). \quad (4.16)$$

A constant, yet representative, value for  $\beta$  must be used in equations (2.8), (2.10), and (2.17). Following Santora<sup>2</sup>, an average scale height  $H_{AVG}$  will be used to evaluate  $\beta$ :

$$\beta^{-1} = H_{AVG} = H_0 + SA \cos \theta_{AVG} , \quad (4.17)$$

where

$$H_0 = \frac{1}{2} (H_{MAX} + H_{MIN}) , \quad (4.18)$$

$$S = \frac{H_{MAX} - H_{MIN}}{H_{MAX} + H_{MIN}} , \quad (4.19)$$

and

$$\cos \theta_{AVG} = \left( \frac{1}{z^2} \right) \left[ Z_1 + \left\{ -Z_1^2 - 2z^2 Z_2 \right\}^{1/2} \right] . \quad (4.20)$$

In the last four equations A is given by equation (2.14);  $H_{MIN}$  and  $H_{MAX}$  are the scale heights at distance  $r_{posc}$  at declination  $\delta_B$  on the day side of the earth and diametrically opposite this point, respectively; and

$$z = \frac{a_m e_m}{H_p} , \quad (4.21)$$

$$Z_1 = z(z-1) - FA(1+FA)^{-1} , \quad (4.22)$$

$$Z_2 = (1+FA)^{-1} - z(1 - \frac{1}{2}z) - \frac{1}{2} . \quad (4.23)$$

$H_p$  in equation (4.21) is the scale height at perigee. If the quantity in curly braces in equation (4.20) becomes negative, then

$$\cos \theta_{AVG} = 0 . \quad (4.24)$$

Finally, it is necessary to adjust the average density,  $\rho_o$ , so that it fits the density at perigee. The adjusted  $\rho_o$  is given by:

$$\rho_o = \rho_p - \frac{1}{2} (\rho_{\max} + \rho_{\min}) FA , \quad (4.25)$$

where  $\rho_p$  is the density at perigee.

#### 4.3 Model Atmosphere Peripheral Support Computations

The atmospheric densities and scale heights used in LAMP are computed using the NSWC/Jacchia 1977-Bass model atmosphere. In order to compute the density and scale height for a given location, certain peripheral computations must be made and the results supplied to the model atmosphere. These data are the time at which the density and scale height are required in modified Julian days,  $t_{MJD}$ ; the solar location,  $a_\odot$  and  $\delta_\odot$ ; the solar obliquity,  $\epsilon_\odot$ ; the satellite location,  $a_s$  and  $\delta_s$ , at  $t_{MJD}$ ; the geomagnetic latitude of the satellite at  $t_{MJD}$ ,  $\phi'$ ; the satellite altitude at  $t_{MJD}$ ,  $h$ ; the solar flux values at  $t_{MJD}$ ,  $F_{10.7}$  and  $\bar{F}_{10.7}$ ; and the geomagnetic index at  $t_{MJD}$ ,  $K_p$ . The solar location computations are discussed in section 4.2. The remaining information is computed as follows:

$$t_{MJD} = 1721044. + 367y - (7y/4) + d + (s/86400.) - 2400001.0 , \quad (4.26)$$

where  $y$  is the year,  $d$  is the day of the year, and  $s$  is the seconds of the day;

$$\delta_s = \sin^{-1} [\sin i \sin (\omega + f)] ; \quad (4.27)$$

$$a_s = \begin{cases} \Omega - a' & \text{for } -\frac{\pi}{2} < \omega + f \leq \frac{\pi}{2} \\ \Omega + \pi + a' & \text{for } \frac{\pi}{2} < \omega + f \leq \frac{3\pi}{2} \end{cases} , \quad (4.28)$$

where

$$a' = \sin^{-1} [k \tan \delta_s \cot i] , \quad (4.29)$$

and

$$k = \begin{cases} +1 & \text{for } i \leq \pi/2 \\ -1 & \text{for } i > \pi/2 \end{cases} ; \quad (4.30)$$

$$\phi' = \sin^{-1} [ .9792 \sin \delta_s + .2028 \cos \delta_s \cos (L_s - 291^\circ) ] , \quad (4.31)$$

where  $L_s$  is the East longitude of the satellite given by

$$L_s = \begin{cases} a_s - a_G & \text{for } a_G \leq a_s \\ 2\pi + (a_s - a_G) & \text{for } a_G > a_s \end{cases}, \quad (4.32)$$

$$a_G = \omega_\oplus (t_{MJD} - t_{\gamma MJD}) , \quad 0 \leq a_G \leq 2\pi , \quad (4.33)$$

and  $\omega_\oplus$  is the rotation rate of the earth and  $t_{\gamma MJD}$  is a recent transit time of the vernal equinox and the Greenwich meridian in modified Julian days;

$$h = \left[ \frac{a_m(1-e_m^2)}{1+e_m \cos f_m} \right] + r_{sp} - \left[ \frac{a_\oplus}{1+\left(\frac{e_\oplus^2}{1-e_\oplus^2}\right)\sin^2 \delta_s} \right]^{1/2} , \quad (4.34)$$

where  $a_\oplus$  and  $e_\oplus$  are the semi-major axis and eccentricity of the reference ellipsoid;

$$F_{10.7} = (F_{10.7})_0 + (F_{10.7})_1 (t - t_o) + (F_{10.7})_2 \sin \left[ \left( \frac{t - t_o}{D_2} \right) \pi + \gamma_2 \right] , \quad (4.35)$$

and

$$\bar{F}_{10.7} = (\bar{F}_{10.7})_0 + (\bar{F}_{10.7})_1 (t - t_o) , \quad (4.36)$$

where  $\gamma_2$  is a phase factor and  $D_2$  is a constant; and

$$K_p = (K_p)_0 + (K_p)_1 (t - t_o) . \quad (4.37)$$

It should be noted that mean or osculating values for  $i$ ,  $\omega$ , and  $f$  are used above when in the MEP or OEP mode, respectively.

#### 4.4 User Support Computations

Additional parameters are computed in LASP to support mission analysis. These parameters are the osculating perigee and apogee altitudes  $h_{p_{osc}}$  and  $h_{a_{osc}}$ ; the descending leg osculating altitude at a given latitude,  $h_{\delta_{osc}}$ ; the phase angle for a two satellite system,  $\Psi$ ; the propellant consumed by an orbit adjust,  $\Delta W_{OA}$ ; and the remaining usable propellant,  $\Delta W$ .

The altitude parameters  $h_{p_{osc}}$ ,  $h_{a_{osc}}$ , and  $h_{\delta_{osc}}$  are computed using equation (4.34) where  $\delta_s$  is computed using

$$\delta_s = \sin^{-1} \left[ \sin (\omega_m + f_m) \sin i_m \right] , \quad (4.38)$$

and

$$f_m = 0 , \quad (4.39)$$

for  $h_{p_{osc}}$ , and

$$f_m = \pi , \quad (4.40)$$

for  $h_{a_{osc}}$ . When computing  $h_{\delta_{osc}}$ ,  $\delta_s$  is known but the associated  $f_m$  must be calculated as follows:

$$f_m = \begin{cases} u - \omega_m & , \text{ for } \omega_m \leq u \\ 2\pi - (\omega_m - u) & , \text{ for } \omega_m > u \end{cases} , \quad (4.41)$$

where

$$u = \pi - \sin^{-1} \left[ \frac{\sin \delta_s}{\sin i_m} \right] . \quad (4.42)$$

The phase angle  $\Psi$  is a measure of the departure of a two satellite system from being dynamically synchronized such that at the instant one satellite (termed the lead vehicle) crosses its descending node, the other (trailing vehicle) crosses its ascending node. The time evolution of the phase angle is computed only for the LTP mode and is in terms of the nodal period of the lead satellite  $\tau_L$ . Thus for the  $n^{\text{th}}$  rev from epoch:

$$\Psi_n = \Psi_{n-1} + \Delta \Psi_n , \quad (4.43)$$

where

$$\Delta\Psi_n = 2\pi \left[ \left( \frac{1}{\tau_1} - \frac{1}{\tau_2} \right) \tau_L + \frac{1}{2} \left( \frac{\dot{\tau}_2}{\tau_2^2} - \frac{\dot{\tau}_1}{\tau_1^2} \right) \tau_L^2 \right]_n , \quad (4.44)$$

and

$$\dot{\tau}_\ell = \frac{3}{2} \left( \frac{\Delta a_D \ell}{a_m \ell} \right)_n , \quad (\ell = 1, 2) . \quad (4.45)$$

The subscripts  $\ell = 1, 2$  designate the satellite being referenced. The user must select one of these as the lead satellite, as well as supply the initial phase angle  $\Psi_0$ .

The propellant expended during the  $i^{\text{th}}$  orbit adjust is computed using the expression:

$$\Delta W_{OA_i} = \left( \frac{W_i}{g I_{sp}} \right) \Delta V , \quad (4.46)$$

where  $g$  is the gravitational acceleration at the Earth's surface,  $I_{sp}$  is the thruster specific impulse,  $W_i$  is the satellite weight at the time of the orbit adjust, and  $\Delta V$  is the instantaneous velocity change given by

$$\Delta V = \left( \Delta V_R^2 + \Delta V_I^2 + \Delta V_C^2 \right)^{1/2} . \quad (4.47)$$

The satellite weight  $W_i$  and weight of remaining usable propellant  $\Delta W_i$  are computed as follows:

$$W_i = W_{i-1} - \Delta W_{OA_i} - \bar{W}_{OPS} (t_{OA_i} - t_{OA_{i-1}}) , \quad W_i > 0 , \quad (4.48)$$

and

$$\Delta W_i = \Delta W_{i-1} - \Delta W_{OA_i} - \bar{W}_{OPS} (t_{OA_i} - t_{OA_{i-1}}) , \quad \Delta W_i \geq 0 , \quad (4.49)$$

where  $t_{OA_j}$  is the time of the  $j^{\text{th}}$  orbit adjust and  $\bar{W}_{OPS} (\geq 0)$  is a user supplied average rate at which propellant is used for nonorbit adjust related operational maintenance.  $W_o$  and  $\Delta W_o$  must be supplied by the user.

## 5. SOFTWARE DESIGN CONSIDERATIONS

### 5.1 Basic Requirements

The LAMP software is coded in FORTRAN IV in such a manner that the program is self-documenting and modular in structure. LAMP may be exercised in either the batch mode or an interactive mode with the user. LAMP output may be displayed either as plots or tables, or both. The plots can be generated in either the batch mode or an interactive 'real time' mode.

## **5.2 Basic Computational Flow**

Details associated with the operational options, the output options, and the required input data are delineated in Tables 5-1, 5-2 and 5-3, respectively. A high level computational flowchart is presented in Figure 5-1.

Table 5-1. Operational Options

Option	Flag	Values	Definitions
<b>Prediction Type</b>	IPT	0 1	Mean Element Prediction Osculating Element Prediction
<b>Prediction Mode</b>	IPM	0 1	Short Term Prediction Long Term Prediction
<b>OEP Element Type</b>	IET	0 1	Keplerian Cartesian (For IPT = 1 only)
<b>Display Mode</b>	IDM	0 1 2	List Only Plot Only List and Plot
<b>Initial Input Element Type</b>	IIE <sub>T</sub>	0 1 2	Mean Brouwer Elements Mean Keplerian Elements Osculating Keplerian Elements
<b>Atmospheric Drag Modeling</b>	IAD	0 1	Do Not Include Drag Modeling Include Drag Modeling
<b>Orbit Adjust Modeling</b>	IOA	0 1	Do Not Include Orbit Adjust Modeling Include Orbit Adjust Modeling

\*These same operational options apply to each satellite in a multiple satellite case.

Table 5-2. Output Options\*

IOP Flag Value	Quantities Displayed†	Comments
0	$t \ a \ e \ i \ \Omega \ \omega \ M$ (or $x \ y \ z \dot{x} \dot{y} \dot{z}$ ) ( $C_D S/W$ ) $\Psi$	Only when IAD = 1
1	$t \ Rev \ No. \ \tau \ h_{posc} \ h_{aosc} \ h_{\delta osc} \ \Psi$ ( $C_D S/W$ ) $F_{10.7} \ K_p$	Only when IAD = 1
2	$t \ \tau \dot{\tau} \ a \dot{a} \ z \dot{z} \ h_{posc} \ h_{aosc}$	Only when IAD = 1
3	$t \ a \dot{a} \ \tau \ (C_D S/W) \ F_{10.7} \ K_p \ h_{posc}$ (or $h_{aosc}$ when IPT = 1)	Only when IAD = 1
4	$t \ \langle \dot{e}_G \rangle \ \langle \dot{i}_G \rangle \ \langle \dot{\Omega}_G \rangle \ \langle \dot{\omega}_G \rangle \ \langle \dot{M}_G \rangle$	Only when IAD = 1
5	$t \ a_{sp} \ e_{sp} \ i_{sp} \ \Omega_{sp} \ \omega_{sp} \ M_{sp}$	—
6	$t \ a_0 \ \delta_\theta \ a_B \ \lambda_\theta \ F_{10.7} \ \bar{F}_{10.7} \ K_p$	Only when IAD = 1
7	$t \ \delta_s \ a_s \ L_s \ \phi' \ h \ F_{10.7} \ \bar{F}_{10.7} \ K_p \ W \ \Delta W$	Only when IAD = 1
8	$t \ \delta_s \ L_s \ h \ \rho \ \frac{\partial \rho}{\partial h} \ H \ F_{10.7} \ \bar{F}_{10.7} \ K_p$	Only when IPT = 1 and IAD = 1
All IOP Values	$t_{OA} \ f_{OA} \ \Delta V_R \ \Delta V_I \ \Delta V_C \ \Delta V \ \Delta W_{OA} \ W \ \Delta W \ \Delta a_{OA} \ \Delta e_{OA} \ \Delta i_{OA} \ \Delta \Omega_{OA} \ \Delta \omega_{OA}$	Only when IOA = 1 and only once at the time of adjust

\*These output options apply to each satellite in a multiple satellite case.

†The phase angle  $\Psi$  is only displayed (and computed) for a two satellite case and the LTP mode.

Table 5-3. Input Data Definitions

Input Data	Definition	Comments
$t_o$	Start time and epoch of input elements	—
$t_E$	End time for predictions	—
$a_o e_o i_o \omega_o \Omega_o M_o$	Initial orbital elements at $t_o$	Element type must agree with IET flag
$N_{REV_o}$	Initial rev number	Needed when IOA=1 or IOP=1
NSAT	Number of satellites	= 1 or 2.
$W_o, \Delta W_o, \bar{W}_{ops}$	See section 4.4	—
$I_{sp}$	Thruster Specific Impulse	—
$\Psi_o$	Initial phase angle	Required only when NSAT=2 and IAD=1
$(C_D S)_i$	See Eq. (4.9)	{
$\Delta$	Subsolar bulge lag angle	
$\Lambda$	See Eq. (2.11)	
$(F_{10.7})_i$	See Eq. (4.35)	
$\gamma_2, D_2$	See Eq. (4.35)	
$(\bar{F}_{10.7})_i$	See Eq. (4.36)	
$(K_p)_i$	See Eq. (4.37)	
$t_\gamma$	Time of last vernal equinox	
$t_{\gamma MJD}$	Time of recent transit of vernal equinox and Greenwich median	
$(N_{REV_{OA}})_i$	Rev number for $i^{\text{th}}$ orbit adjust	{
$(f_{OA})_i$	True anomaly of ignition for $i^{\text{th}}$ orbit adjust	
$(\Delta V_j)_i$	R, I, C impulse velocity components for $i^{\text{th}}$ orbit adjust [see Eqs. (2.20)-(2.23)]	
$\Delta t$	Computation granularity [see Eqs. (2.1)-(2.2)]	For IPM=0 only
